Multi Web Width Ink Rails

Why should you keep installing new ink rails in your Goss Colorliner, Headliner Offset and Metro Color Presses every time you change your web width? As you already know, every time you install new ink rails, you have all the problems associated with this. Removing the old ink rails, disconnecting all the ink hoses, installing the new ones, re-setting the new ink rails, etc. Install our multi web width ink rails in your press and never go through all this extra work again. Our multi web width ink rails are ready to run 55 inch thru 46 inch web widths. You can purchase these ink rails at the web width you are currently on, or getting ready to change to, with the option to go to any other web width from 55 inch to 46 inch by just changing our ink rail kits. We have had these multi web width ink rails installed in Headliner Offset, Colorliner and Metro Color Presses since 1993 and have presses currently running our 48 inch web width kits. We even have orders in house for our 46 inch kits.

We also have an ink rail kit for the Metroliner presses. These kits use our one piece aluminum ink rail, which is adapted to your existing Metroliner press ink rail brackets. This will eliminate those heavy steel ink rail castings you are currently using and changing. We have had one of these ink rails in and running now since 2003 at the Los Angeles Times Costa Mesa printing plant.

Web Width Reduction Kit

Contact Precision Press Products, LLC for information on putting these ink rails in your press this time instead of continuing to change your ink rails every time you change web widths.
